

Player Checkpoint System

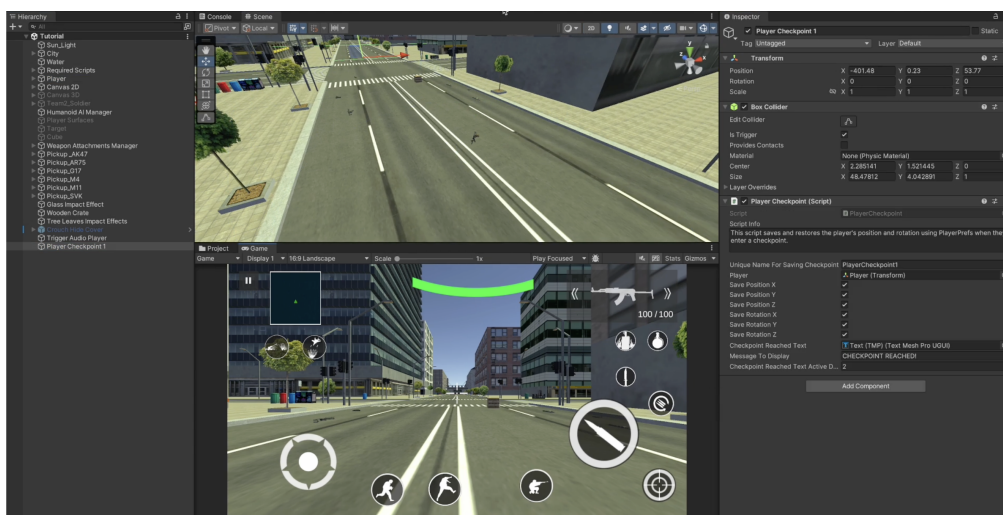

Introduction

This video will guide you on how to setup the player checkpoint system with a guided arrow.

Create Player Checkpoint

Step 1: Create an empty gameObject
Step 2: Add a primitive collider i.e Box Collider
Step 3: Add component 'Player Checkpoint' to it.

Assign the necessary gameObjects and components like shown in the video above.
Your setup should look like this [See the image below].

Player Checkpoint

This script saves and restores the player's position and rotation using PlayerPrefs when they enter a checkpoint.

Fields	Info
UniqueNameForSavingCheckpoint	Unique key used to store and retrieve the player's checkpoint data in PlayerPrefs.
Player	Reference to the player's transform.

SavePositionX	Whether to save and load the player's X position.
SavePositionY	Whether to save and load the player's Y position.
SavePositionZ	Whether to save and load the player's Z position.
SaveRotationX	Whether to save and load the player's X rotation.
SaveRotationY	Whether to save and load the player's Y rotation.
SaveRotationZ	Whether to save and load the player's Z rotation.
CheckpointReachedText	Text element that displays a message when a checkpoint is reached.
MessageToDisplay	The message that will be shown when the checkpoint is reached.
CheckpointReachedTextActiveDuration	Duration (in seconds) for which the checkpoint reached message stays visible.

Create Player Destination Arrow

You can drag and drop the prefab located in Mobile Action Kit < Art < Destination Pointing Arrow < DestinationArrow_Prefab and make it to be child of the Player camera. Your setup should look like this [See the Image]

Destination Arrow

This script saves and restores the player's position and rotation using PlayerPrefs when they enter a checkpoint.

Fields	Info
PlayerWaypoints	List of waypoints the arrow will point towards.
RotationSpeed	Speed at which the arrow rotates towards the next waypoint.
MinWaypointSwitchDistance	Minimum distance to the waypoint before updating to the next one.
MaxWaypointSwitchDistance	Maximum distance to the waypoint before updating to the next one.
