

Insendiary & Explosive Grenade Setup

Part 1

Introduction

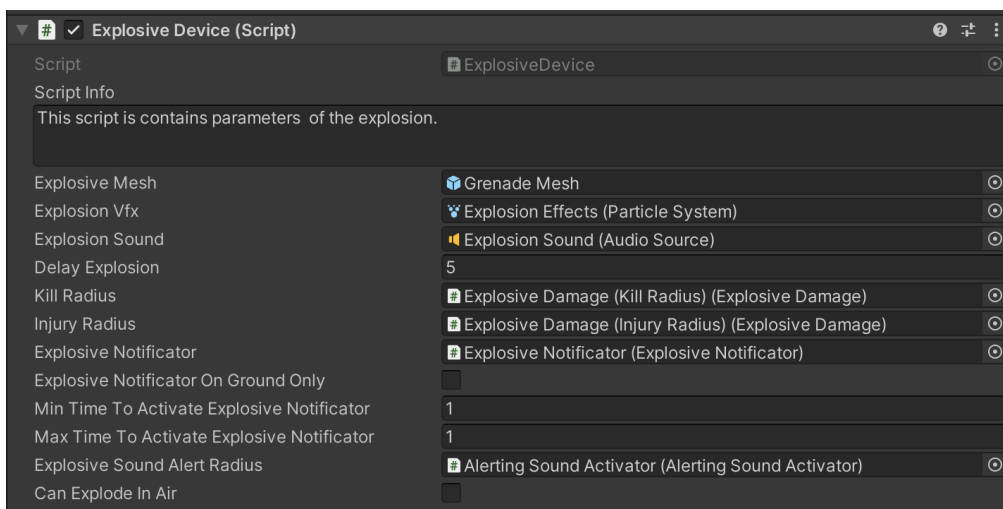

This is the Part-1 Player Grenades and in this part you will learn how to setup insendiary and explosive grenades for the 'Player' to throw at enemies.

Player Grenade Setup

To be able to setup the grenade you need to follow the above tutorial which will guide you step by step on how to setup the grenade.

Explosive Device

This script contains parameters of the explosion.

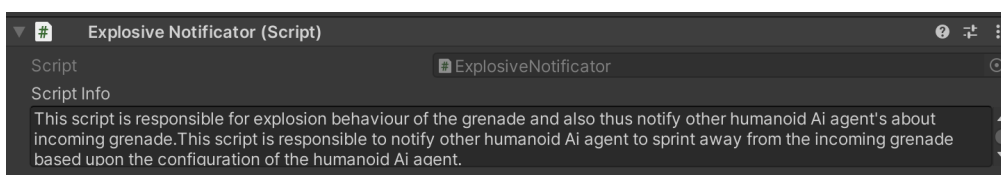

Fields	Info
Explosive Mesh	Drag and drop the Explosive gameObject from the hierarchy into this field to deactivate when it will explode.
Explosion Vfx	Drag and drop Explosive`s child VFX explosion prefab into this field.
	Drag and drop explosion sound from the project tab.

Explosion Sound	
Delay Explosion	Specify delay before explosion.
Kill Radius	Drag and drop the component called 'Kill radius' from the hierarchy into this field.
Injury Radius	Drag and drop the component called 'Injury radius' from the hierarchy into this field.
Explosive Notificator	Drag and drop the gameobject component called 'Explosive Notificator' with the script called 'Explosive Notificator' from the Explosive hierarchy into this field.
Explosive Notificator On Ground Only	If enabled than Ai agent may or may not react to the incoming Explosive depending on the situation and in case the Explosive alert behaviour is activated on that Ai agent or not. If enabled then 'ExplosiveNotificator' will be activated only after Explosive is landed on the surface.
Min Time To Activate Explosive Notificator	Minimum time to wait before activating ExplosiveNotificator radius.
Max Time To Activate Explosive Notificator	Maximum time to wait before activating ExplosiveNotificator radius.
Explosive Sound Alert Radius	Drag and drop game object named 'ExplosiveSoundAlertRadius' with Sound Manager Script attached to it from the Explosive hierarchy into this field.
Can Explode In Air	If checked than the explosion timer will start from the launch of the Explosive, but if unchecked than the timer will start only upon landing of the Explosive.
Explosive Rigidbody Mass	Specify the value for Explosive rigidbody mass.

Explosive Rigidbody Drag	Specify the value for Explosive rigidbody drag.
Explosive Rigidbody Angular Drag	Specify the value for Explosive angular drag.
Explosive Rigidbody Use Gravity	If checked, rigidbody will use gravity.
Explosive Rigidbody Is Kinematic	If checked, rigidbody will be set as kinematic.
Explosive Rigidbody Interpolate	Specify the rigidbody interpolation.
Explosive Rigidbody Collision Detection Mode	Choose one of the collision detection modes for the rigidbody.
Force Momentum On Collision	Determines the force momentum applied to the grenade in the forward direction when it collides with an object such as a wall or roof. Example: If set to 10, the grenade will experience a forward impulse force of 10 units upon collision.

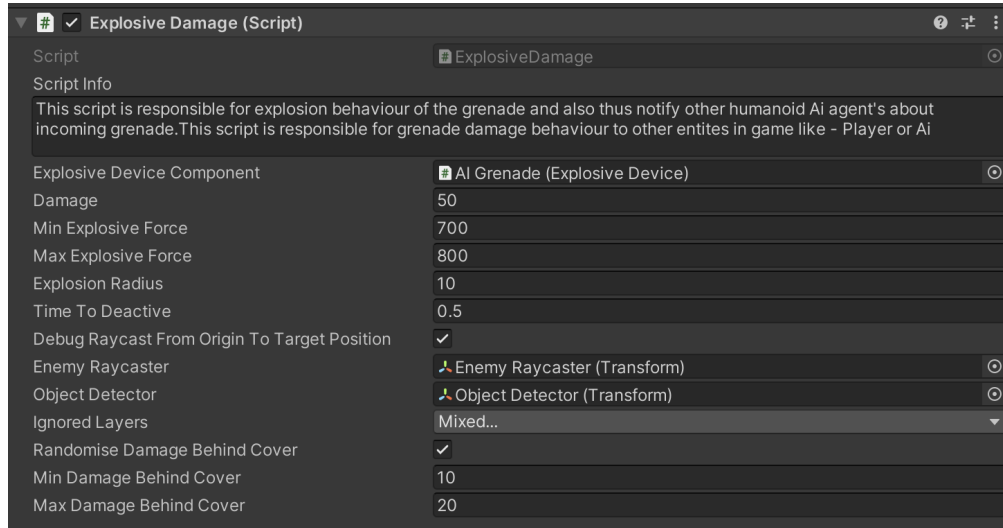

Explosive Notificator

This script is responsible for explosion behaviour of the grenade and also thus notify other humanoid Ai agent's about incoming grenade. This script is responsible to notify other humanoid Ai agent to sprint away from the incoming grenade based upon the configuration of the humanoid Ai agent.

Explosive Damage

This script is responsible for explosion behaviour of the grenade and also thus notify other humanoid Ai agent's about incoming grenade. This script is responsible for grenade damage behaviour to other entites in game like - Player or Ai.

Fields	Info
Explosive Device Component	Drag and drop 'ExplosiveDevice' script from the hierarchy into this field.
Damage	Specify the damage the grenade will give to other entities if touched by this trigger. In case target is behind a wall or cover then this value will not be used.
Min Explosive Force	Minimum explosive force value will be applied to other Humanoid AI agents on grenade explosion. The higher the value, the higher the humanoid AI agent will fly if caught in the grenade trap. For the player, this value is not true, but you can add a camera shaker effect script to the player's camera and tweak the values there, which will shake the player's camera.
Max Explosive Force	Maximum explosive force value will be applied to other Humanoid AI agents on grenade explosion. The higher the value, the higher the humanoid AI agent will fly if caught in the grenade trap. For the player, this value is not true, but you can add a camera shaker

	effect script to the player's camera and tweak the values there, which will shake the player's camera.
Explosion Radius	Explosive radius value will be applied to other Humanoid AI agents on grenade explosion if they are within the explosion radius. The higher the value, the higher the humanoid AI agent will fly if caught in the grenade trap. For the player, this value is not true, but you can add a camera shaker effect script to the player's camera and tweak the values there, which will shake the player's camera.
Time To Deactivate	Time to deactivate the grenade damage script.
Debug Raycast From Origin To Target Position	If enabled, then before explosion, this script will draw a raycast from the origin point to the target destination.
Enemy Raycaster	Drag and drop the enemy raycaster gameObject from the hierarchy into this field.
Object Detector	Drag and drop the object detector gameObject from the hierarchy into this field.
Ignored Layers	Specify the layers to be ignored when raycasting using 'EnemyRaycaster' and 'ObjectDetector'.
Randomise Damage Behind Cover	If enabled, then either the 'MinDamageBehindCover' will be applied or the 'MaxDamageBehindCover' on grenade explosion. If disabled, then only 'MinDamageBehindCover' will be applied.
Min Damage Behind Cover	Specify the minimum damage to give to the target behind cover.
Max Damage Behind Cover	Specify the maximum damage to give to the target behind cover.
